Artifact for Interactive Bit Vector Reasoning using Verified Bitblasting

.1 Artifact check-list (meta-information)

A Introduction

This artifact contains the infrastructure and tooling necessary to display the performance of the verified bitblaster introduced by the paper for all the benchmarks presented.

- **Program:** The code repository for our framework along with the test suite. Note that this is already setup in the docker image.
- Compilation: The Lean4 toolchain, downloaded via elan. Note that this is already setup in the docker image.
- Run-time environment: Any operating system that supports Docker.
- Hardware: Any x86-64 machine.
- Output: Key theorems of the paper will be built and shown to have no unsound axioms.
- How much disk space required (approximately)?: 30GB
- How much time is needed to prepare workflow (approximately)?: 1hr
- How much time is needed to complete experiments (approximately)?: 5hr
- Publicly available?: Yes
- Code licenses (if publicly available)?: MIT
- Archived (provide DOI)?: 10.5281/zenodo.15755236

A.1 Performance

We test the performance of the verified bitblaster bv_decide against three benchmarks:

- InstCombine benchmark, extracted from LLVM's peephole verifier
- HackersDelight benchmark, containing bit-vector theorems extracted from the first two chapters of Hackers' Delight
- SMT-LIB benchmark, containing the problems from SMT-LIB's 2024 Competition

The artifact contains the benchmarks, the scripts to evaulate bv_decide's performance, and the scripts to reproduce the plots in the paper.

B Hardware Dependencies

Podman or Docker are necessary to run our artifact (we tested it with the former). The container image has all dependencies needed to compile our framework with Lean4. TODO: add info

C Getting Started

Access the docker image from 10.5281/zenodo.15755236:

```
$ docker load -i oopsla25-bv-decide.tar
$ docker run -it oopsla25-bv-decide
$ cd /code/lean-mlir && lake clean && lake exe cache get && lake build
# Run experiments InstCombine and HackersDelight
# Collect the output and write the plots
$ /code/lean-mlir/artifacts/oopsla25-bv-decide/run.sh
```

Temporary page!

LATEX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because LTEX now knows how many pages to expect for this document.
